

# Unauthorized user detector

---

# About our program

---

- Our program uses node.js for running javascript in local system. Currently it only works in a pc or laptop. Our program aims to Decrease the vulnerability of hacking or unauthorized access of Someone's account. It works like a person has used a wrong pin it will automatically click the photo of the person and upload it to the cloud.

- Currently because we were given a short period of time we weren't able to put
- another feature of detecting the masks and any coverage of the face.
- With this public code anyone can use it to use an advance safety measure to protect the privacy of his users.
- In future we intend to do some innovations in it to make it more advanced.
